**PRODUCT/AREA:** Design

Subject: Customize Magnetic tracks position

It is possible to create your own customized .cardModel and in it modify the position of the mag tracks on the layout.
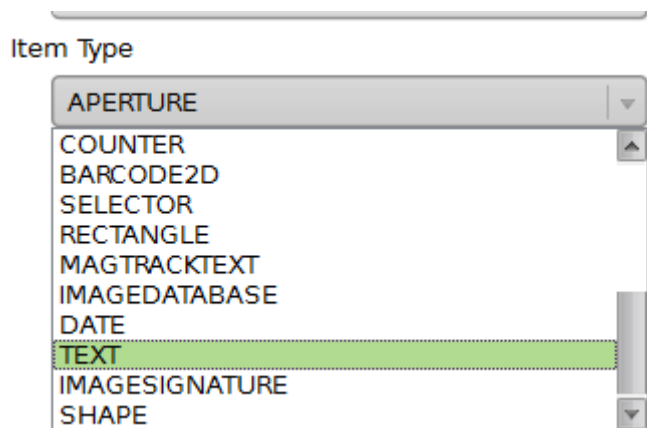

Open a new HiCo card:

Then go to cardPresso's menu **File** -> **Save as** and save it as .cardModel.
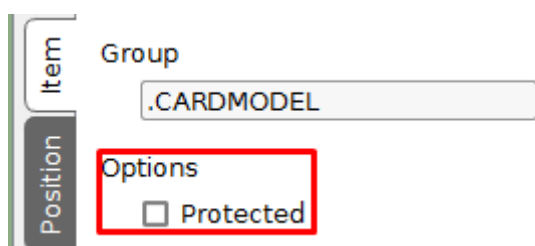

Browse your computer for the .cardModel file you've just saved and open it.

When you open the .cardModel you'll be able to use the options in the **Item** and **Model** tabs to modify the elements.
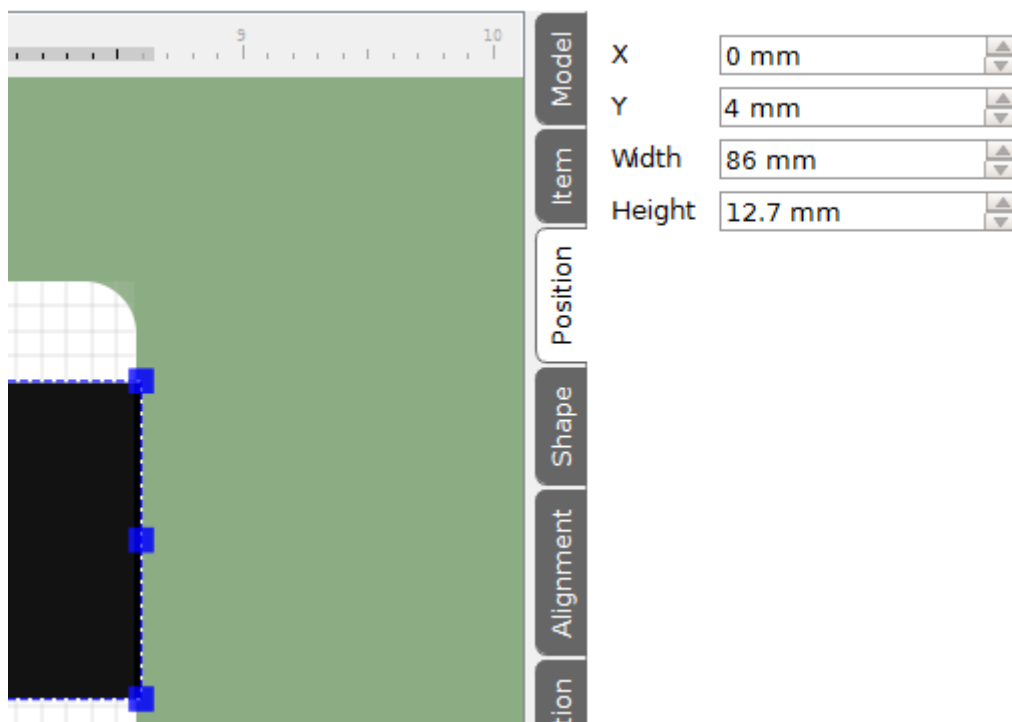

After clicking the element you intend to modify, change its Type to text:

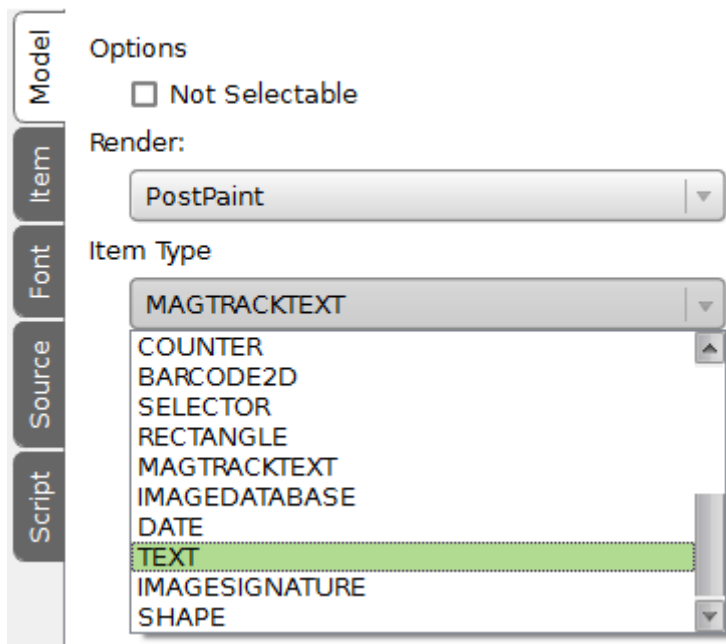

Click outside of the object and then back in it. Uncheck the **Protected** option in the Item tab.

Click outside of the object and then back in it. You can now modify its dimensions and location in the Position tab.
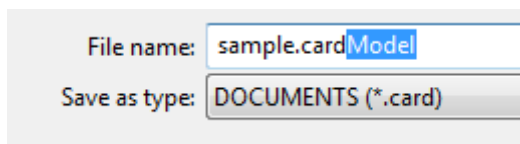

After the edition is complete, revert the items to their original Type and Protection settings.

After the customization is complete save the file with .card extension.

To do so, use the **Save As** option under cardPresso's menu **File**, delete the Model part of the extension (as highlighted in the print screen below) and save the file as **.card**.

Close the file in cardPresso, browse your computer for the .card you've just saved and double click to open it. You can now use this file to print operations.
